

## Domain-Specific Screening Tools

Revised January 2022

Domain-specific screening tools can be useful in a number of situations, including when a provider is unsure what to do following the use of first-line screening tool (e.g., scores fall in the borderline range and discussion with parent does not clarify the situation) or if a provider wants to determine whether a more specific clinical issue might be present than is indicated by a first-line, broadband measure (e.g., anxiety, ADHD). In such situations, administering a more comprehensive or more specific screening tool can provide helpful information that can be integrated into a provider's understanding of the child's behavior and their decision-making about follow-up. As with the use of broadband screening tools, domain-specific screening tools should not be used diagnostically. Positive screening results merely indicate risk for problems in the area assessed, and negative screening results do not indicate the absence of mental health challenges. Clinical judgment and parental or personal concern should be considered when determining a course of action. Note that the AAP Mental Health Toolkit also has a comprehensive list of screening tools: <https://www.aap.org/en-us/advocacy-and-policy/aap-health-initiatives/Mental-Health/Pages/Addressing-Mental-Health-Concerns-in-Primary-Care-A-Clinicians-Toolkit.aspx>.
